

Bachelor's Thesis

Developing Efficient Data Structures and Algorithms for Web
Applications: Optimizing Python Performance using WebAssembly
(Wasm)

Abstract

This thesis investigates the development of efficient data structures and algorithms (DSA) for web applications, specifically focusing on optimizing Python performance through WebAssembly (Wasm). The research evaluates the integration of high-performance modules written in Rust and Zig into Python-based systems. By benchmarking various data structures, including Linked Lists, Heaps, and Red-Black Trees. This study quantifies the performance gains achieved when moving computationally intensive tasks from the Python interpreter to the Wasm execution environment.

Keywords: WebAssembly, Rust, Zig, Data Structures, Performance Optimization, Python, Benchmarking.

Contents

Introduction	2
1.1 Motivation and Relevance	2
1.2 Objectives	3
1.3 Problem Statement	4
1.4 Hypotheses	5
2. DSA Python Implementation	5
2.1 Overview	6
2.2 Time and Space Complexity	7
2.3 Data Structures	8
2.4 Linked Lists	9
2.4.1 Singly Linked List	9
2.4.2 Doubly Linked List	9
2.5 Stack	10
2.6 Queues	11
2.6.1 Priority Queue	11
2.7 Heaps	12
2.8 Trees (AVL, RBTREE)	13
2.9 Hashmap	14
3. Quantitative Performance Analysis	14
3.1 Environment Setup	15
3.2 Benchmarking Results	16
3.3 Discussion	17
4. Systems Programming Fundamentals (Rust & Zig)	17
4.1 The Case for Rust	18
4.2 Memory Safety and the Borrow Checker	19
4.3 WebAssembly Integration	20
4.4 The Role of Zig in Performance Modules	21
5. Hybrid Implementations (Rust/Zig in Python)	21
5.1 PyO3 and Maturin Integration	22
5.2 C-FFI and Zig Modules	23
5.3 Comparative Analysis	24
Conclusion	24
References	24

Introduction

1.1 Motivation and Relevance

1.2 Objectives

1.3 Problem Statement

1.4 Hypotheses

2. DSA Python Implementation

2.1 Overview

2.2 Time and Space Complexity

2.3 Data Structures

2.4 Linked Lists

2.4.1 Singly Linked List

2.4.2 Doubly Linked List

2.5 Stack

2.6 Queues

2.6.1 Priority Queue

2.7 Heaps

2.8 Trees (AVL, RBTreE)

2.9 Hashmap

3. Quantitative Performance Analysis

3.1 Environment Setup

3.2 Benchmarking Results

3.3 Discussion

4. Systems Programming Fundamentals (Rust & Zig)

4.1 The Case for Rust

4.2 Memory Safety and the Borrow Checker

4.3 WebAssembly Integration

4.4 The Role of Zig in Performance Modules

5. Hybrid Implementations (Rust/Zig in Python)

5.1 PyO3 and Maturin Integration

5.2 C-FFI and Zig Modules

5.3 Comparative Analysis

Conclusion
